

The Mysterious Collapse of World Trade Center 7: A Frame-by-Frame Analysis

On September 11, 2001, the World Trade Center 7 building collapsed at 5:20 PM EST. The collapse occurred approximately seven hours after the collapse of the World Trade Center 1 and 2 towers, which were destroyed in a terrorist attack earlier that day.

The collapse of World Trade Center 7 was a significant event, as it was the first time that a steel-framed skyscraper had ever collapsed due to fire. The collapse has been the subject of much debate and controversy, with some experts arguing that the collapse was caused by fire, while others argue that it was caused by a controlled demolition.

In her book, "The Mysterious Collapse of World Trade Center 7: A Frame-by-Frame Analysis," Judy Wood argues that the collapse of World Trade Center 7 was not caused by fire, but by a controlled demolition. Wood

bases her argument on a detailed analysis of the video footage of the collapse, which she claims shows evidence of explosives being used to bring down the building.

Wood's book has been praised by some for its thoroughness and attention to detail. However, it has also been criticized by some experts, who argue that Wood's analysis is flawed and that her s are not supported by the evidence.

The debate over the cause of the collapse of World Trade Center 7 is likely to continue for many years to come. However, Wood's book provides a valuable contribution to the discussion, and it is a must-read for anyone who is interested in the events of September 11, 2001.

Evidence for a Controlled Demolition

In her book, Wood presents a number of different arguments to support her claim that the collapse of World Trade Center 7 was caused by a controlled demolition. These arguments include:

- The speed and symmetry of the collapse
- The presence of molten metal in the wreckage
- The lack of debris
- The presence of explosives residue

Wood argues that the speed and symmetry of the collapse are inconsistent with the collapse of a building due to fire. She points out that the building collapsed at a rate of free fall, which is only possible if the building's supports are suddenly removed.

Wood also argues that the presence of molten metal in the wreckage is evidence of a controlled demolition. She points out that molten metal is not typically found in the wreckage of buildings that have collapsed due to fire.

Wood also argues that the lack of debris is evidence of a controlled demolition. She points out that the collapse of World Trade Center 7 produced relatively little debris, which is inconsistent with the collapse of a building due to fire.

Finally, Wood argues that the presence of explosives residue is evidence of a controlled demolition. She points out that explosives residue was found in the wreckage of World Trade Center 7, which is consistent with the use of explosives to bring down the building.

The collapse of World Trade Center 7 is a complex and controversial event. There is no doubt that the collapse was a tragedy, and it is important to remember the victims of that day. However, it is also important to understand the cause of the collapse, so that we can prevent similar tragedies from happening in the future.

Judy Wood's book, "The Mysterious Collapse of World Trade Center 7: A Frame-by-Frame Analysis," provides a valuable contribution to the discussion of the cause of the collapse. Wood's analysis is thorough and detailed, and she presents a number of compelling arguments to support her claim that the collapse was caused by a controlled demolition.

Whether or not you agree with Wood's s, her book is a must-read for anyone who is interested in the events of September 11, 2001.
